DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed 6/20/07 have been fully considered but they are not persuasive.

Applicants have argued the definition of puncturing to be as defined in "Punctured Convolutional Codes of Rate (n-1)/n and Simplified Maximum Likelihood Decoding" by Cain, Clark jr., and Geist. Herein after Cain et al. Applicants included the Cain et al reference in the arguments however did not cite it on a 1449. Therefore the examiner will cite it in an 892.

Applicants argued that added claim language" the puncturing including removing bits from the channel coded encoder packet" makes clear that the Cain et al definition of Puncturing is to be used. This argument is persuasive. The examiner will therefore read the claim limitation of puncturing to be the puncturing as defined by Cain et al.

The examiner notes however that the claim language is written in the alternative. "puncturing and/or repeating the channel coded encoder packet". While the examiner agrees that Bruckman does not teach the "puncturing" as now defined. Bruckman still teaches the repeating See Board Decision of 4/20/07. When the output fragment is "Based entirely on the size of the input packet does not exceed the determined fragment size" this is the claimed repeating.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-5, 14, and 16-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bruckman PN 2002/0051466 in view of Applicants admitted prior art and Tiedemann, Jr. et al PN 5,914,950.

In regards to claims 1, 2, 14, 16, 18, 20-21 and 23: Bruckman teaches channel coding packets to produce channel coded packets (See abstract); and repeating (transmitting the packets that do not exceer the determined fragment size) the channel coded packets to produce a first sub-packet (fragment) having a first size based on a size of the packet and a first data transmission rate at which the first sub-packet is to be transmitted (See abstract and paragraph 0026). Bruckman teaches the dynamic transmission rate control above. Bruckman et al also teaches the first data transmission rate is based on first measured channel conditions however these conditions are measured at the front end not the receiver. Applicants admitted prior art teaches using measuring channel conditions at the receiver and transmitting either the channel conditions or the desired transmission rate based upon the channel conditions to the transmitter. (see page 1 lines 26-32). It would have been obvious to a person of ordinary skill in the art at the time of the invention to use the receiver condition measurements because this would have allowed for considering the entire channel not just a small part. Tiedemann, Jr. et al teaches the transmitter selection a transmission rate that is different from and based upon the desired

Application/Control Number: 09/725,393

Art Unit: 2111

maximum transmission rate of the receiver (Column 11 lines 43-64). It would have been obvious to use a data transmission rate that is different from and based upon the desired maximum transmission rate of the receiver because this would have taken into account factors such as power requirements and other transmitters (see Tiedemann, Jr. et al Column 11 lines 43-64)

In regards to claim 3: Bruckman et al teaches recombining the sub-packets (by reassembler 34).

In regards to claims 4-5: Bruckman et al teaches the size of each fragment being individually determined and the size being variable within a range since packets are digital the sizes have only a discrete number of possibilities. Thus Bruckman et al teaches both the fragments being different sizes and the fragments being of the same sizes.

In regards to claims 17, 19 and 22: applicants admitted prior art teaches the use of a NACK message.

4. Claims 6-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bruckman PN 2002/0051466 in view of applicants admitted prior art and Tiedemann, Jr. et al PN 5,914,950 as applied to claim 1 above, and further in view of Buchholz et al PN 5,337,313.

In regards to claims 6-7: Bruckman teaches the dynamic packet size and rate as described above. Bruckman teaches adding a packet start and a packet end in accordance with the FRF.12 protocol instead of adding a packet size identifier. Bruckman states that while the invention is described in conjunction with the FRF.12 protocol it is not to be limited to that protocol. Bruckman also gives an example of the ATM protocol which includes a five-byte

Art Unit: 2111

header but does not give details of the header information. Buchholz et al teaches a packet reassembly header (406) that includes a packet length field (660). It would have been obvious to a person of ordinary skill in the art at the time of the invention to include a packer size identifier because this would have allowed for the receiver front end to handle packet reassembly more efficiently.

In regards to claims 8 and 12: Bruckman teaches transmitting the fragments based upon their individual transmission rates however Bruckman does not expressly teach modulating the data. Official notice is taken that modulating data to transmit data is well known. For example Modems which stand for Modulator/demodulator. It would have been obvious to modulate the data because this would have allowed for the use of standard modems which have the advantage of having good resistance to noise on the wire.

In regards to claims 9 and 13: Bruckman stares that it is not required to inform the receiver of the transmission rate however it is advantageous to provide the rate information to the receiver/reassembler paragraph 0027.

In regards to claims 10-11: Buchholz et al teaches a protocol field that indicate the packet protocol.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

PN 4504944 to Johannes teaches returning the received data rate for each channel.

Application/Control Number: 09/725,393

Art Unit: 2111

PN 2002/0009061 to Willenegger teaches a data rate feedback.

PN 6,088,385 to Liu teaches a data rate feedback.

PN 6,694,469 to Jalali et al teaches using a feedback signal from the receiver to determine the data transmission rate.

PN 5,574,979 to West teaches fragmenting data into multiple data rates based upon a feedback signal from the receiver(s).

PN 6,298,092 to Heath, Jr. et al teaches the desired data rate at a receiver determines a feedback signal to the transmitter that is used to select the actual data transmission rate.

PN 5,682,379 to Mahany et al teaches the receiver selecting the data transmission rate.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul R. Myers whose telephone number is 571 272 3639. The examiner can normally be reached on Mon-Thur 6:30-4:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Rinehart can be reached on (571) 272-3632. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
